INIT's ID and Account based ticketing.

INIT will be showcasing their ID-based ticketing solution that helps public transport companies to offer passengers more convenience while improving their sales. Rather than using traditional card-based ticketing systems, ID-based systems hold the customer data and business logic in their data systems. With the app for mobile dispatching, MOBILEmodi, INIT provides a tool for employees to manage operations using an Android device. The app enables traffic supervisors to have the same access to relevant ITCS information as dispatchers in the control center. It provides relevant support for dealing with major events, accidents or delays. The COPILOTapp also manages voice and data communication with the control center. The app for real-time passenger information, DEPARTURESlive, is now available for Android and iOS. More information about these digitalized ticketing apps can be found at **Hall 2.1 at Stand 311**.
